

7) Design a python program using regular expression to.

- Extract Email ID's from a given text
- validate the user password with minimum length = 6 and maximum length = 16 and must have at least one lower case letter, upper case letter, number and special symbol (#, @, \$, -)

7a) import re

s = input("enter a string")

words = s.split()

for word in words:

obj = re.match("^[0-9A-Za-z]+@[a-zA-Z0-9]+  
+\\.[a-zA-Z]\*", word)

if obj:

print(word)

else:

print(None)

Ans  
21/12/21

7b) import re

password = input("enter a password")

obj = re.match("(?=.\*[a-z])(?=.\*[A-Z])

(?=.\*[0-9])(?=.\*[-@#\$])[0-9a-zA-Z\_-@#\$]  
{6,16}\$", password)

if obj:

print("valid password")

else:

print("Invalid password")

Output :

7a)

enter a string chaithanya762@gmail.com and my  
other mail ID is docse0192@vce.ac.in and my  
yahoo ID is chai@yahoo.com

chaithanya762@gmail.com

docse0192@vce.ac.in

chai@yahoo.com

7b) enter the password chaithanya

invalid

enter the password ammu@1234#

valid.

8) Perform the following file operations using Python program.

a) Traverse a path and display all the files and subdirectories in each level until the deepest level for a given path, Also display the total number of files and subdirectories.

b) Read a file content and copy only the contents at odd lines into a new file.

a) import os

```
path = os.walk("F:/filehandler/good morning")
```

```
filecount = 0
```

```
foldercount = 0
```

```
for root, subdirectories, file in path:
```

```
    print("root", root)
```

```
    print("subdirectories", subdirectories)
```

```
    print("files", file)
```

```
    filecount += len(file)
```

```
    foldercount += len(subdirectories)
```

```
print("Total files", filecount)
```

```
print("Total subdirectories", foldercount)
```

b) ~~file1 = open("F:/filehandler/helloworld.txt")~~

~~string = file1.read()~~

~~line = string.splitlines()~~

~~oddlines = ""~~

Experiment No. 08

Date 28/12/21

Page No.

13

Name of Experiment Read & copy contents at odd lines to another file

```
for index in range(0, len(lines), 2):  
    oddlines += lines[index] + '\n'  
file2 = open("F:/filehandler/good.txt", 'w')  
file2.write(oddlines)  
file2.close()  
file1.close()  
print("compiled")
```

Done  
21/12/22

Output :-

8a) root F:/filehandler/goodmorning

subdirectories ['chaithanya', 'New folder']

files ['program.txt', 'python.txt']

root F:/filehandler/goodmorning\chaithanya

subdirectories []

files ['New Text document.txt', 'New Text document1.txt']

root F:/filehandler/goodmorning\New folder

subdirectories []

files []

Total files 4

Total subdirectories 2

Output:-

Completed.

FILE 1

□helloworld - file

hello world

I'm chaithanya

good morning

how are you?

hope you are doing good

take care

FILE 2

□good - file

hello world

good morning

hope you are doing good

- 9) Develop an application using 'tkinter' package to randomly assign program no's for students and store assigned details in csv file

```
from tkinter import *  
import random
```

```
window = Tk()  
window.title("Program 9")  
window.geometry("300x250")
```

```
message = StringVar()
```

```
lab1 = Label(window, text="Randomly assigning programs")  
lab1.grid(row=0)
```

```
lab2 = Label(window, text="enter no of students")  
lab2.grid(row=1, column=0)
```

```
students = Entry(window)  
students.grid(row=1, column=1, pady=10)
```

```
lab3 = Label(window, text="enter no of programs")  
lab3.grid(row=2, column=0)
```

```
program = Entry(window)  
program.grid(row=2, column=1)
```

lab 4 = Label (window, textvariable = message)

lab 4.grid (row = 4)

def buttonClicked():

no-of-students = students.get()

no-of-programs = program.get()

data = ""

if no-of-students.isdigit() and no-of-programs.isdigit():

for i in range(1, int(no-of-students)+1):

data += "student " + str(i) + ", " + "program"

data += str(random.randint(1, int

(no-of-programs))) + "\n"

file = open("students.csv", "w")

file.write(data)

file.close()

msg = message("File (student.csv) is ready,  
you can open it")

else:

msg = message.set("invalid")

btn = Button (window, text = "submit", command = buttonClicked)

btn.grid (row = 3)

window.mainloop()

Don

8/2/21

Output:-

PROGRAM 9

Randomly assigning programs to students

enter no of students

enter no of programs

File (student.csv) is ready, you can open it.

Student.csv

student 1, program 1

student 2, program 1

student 3, program 3

student 4, program 4

student 5, program 3

- 10) Create an interactive dictionary application in Python by reading the external TSON file which contains words and different meanings associated with it. Program will ask the user for a word and returns the meaning for the user given word from the TSON file, if the actual meaning is not available for the user given word, the program should through suggestion to user by analyzing the word to check if a user somehow mistypes the word and meant something else.

```
import json
import difflib
file = open("meaning.json")
dictionary = json.load(file)
word = input("enter a word")
if word in dictionary.keys():
    print("meaning of word:", word, "-", dictionary[word])
else:
    similar = difflib.get_close_matches(word, dictionary.keys())
    if len(similar) > 0:
        similar = similar[0]
        print("Did you mean", similar, "? yes or no")
        yesn = input()
        if yesn == "yes":
            print("Meaning of word:", similar,
                  "-", dictionary[similar])
```

Experiment No. 10

Date 8/2/22

Page No.

17

Name of Experiment

else:

print("no match found")

else:

print("no match found")

[additional json file]  
meaning.json

```
{  
  "A-game": "one's highest level of performance",  
  "angry": "angry ; irritated",  
  "hell": "meaning to talk admiringly",  
  "park": "a public garden or area for recreation"  
}
```

Output :-

1) enter a word: park

meaning of word: park - a public garden or  
area for recreation.

2) enter a word: Agame

Did you mean A-game? say yes or no

yes

meaning of word: A-game - one's highest level  
of performance

3) enter a word: hello

no match found.
